ABSTRACT.......................................................................................................... vi

KATA PENGANTAR .......................................................................................... vii

DAFTAR ISI ...................................................................................................... viii

BAB

I PENDAHULUAN ............................................................................................... 1
1.1. Latar Belakang .......................................................................................... 1
1.2. Rumusan Masalah .................................................................................... 2
1.3. Tujuan Penelitian .................................................................................... 2
1.4. Batasan Masalah ...................................................................................... 3
1.5. Hipotesis ................................................................................................... 3
1.6. Hasil Yang diharapkan .......................................................................... 3
1.7. Manfaat Penelitian ................................................................................. 3

II TINJAUAN UMUM .......................................................................................... 6
2.1. Lokasi Kesampaian Daerah .................................................................... 6
2.2. Geologi Umum ......................................................................................... 7
2.3. Kegiatan Penambangan ........................................................................ 9
2.4. Sistem Penyangga .................................................................................. 11

III DASAR TEORI .............................................................................................. 16
3.1. Klasifikasi Rock Mass Rating (RMR) .................................................. 16
3.2. Kriteria Runtuh Hoek & Brown ............................................................ 17
3.3. Analisis Balik .......................................................................................... 19
3.4. Keberadaan bidang diskontinu dalam mengontrol Kestabilan lubang bukaan .................................................................................. 20
3.5. Tegangan Insitu ....................................................................................... 21
3.6. Tegangan di sekitar lubang bukaan (tegangan terinduksi) .................. 22
3.7. Metode Elemen Hingga (Finite Element Method) ............................ 18
3.8. Sistem penyanga pada tambang bawah tanah ................................... 29
3.8.1. Baut batuan (rockbolt) ................................................................... 30
3.8.2. Beton tembak (shotcrete) ............................................................... 32
3.8.3. Kawat Baja (wiremesh) ................................................................. 34
3.9. Perhitungan Faktor Keamanan ........................................................... 35

IV HASIL PENELITIAN ..................................................................................... 37
4.1. Data Empirik ........................................................................................... 37
4.1.1. Uji Kuat Tekan Batuan Utuh (UCS) ............................................... 39
4.1.2. Pengukuran Rock Quality Designation (RQD) .......... 40
4.1.3. Pengukuran Bidang Diskontinu ..................................... 40
4.2. Data Analitik ........................................................................ 41
4.2.1. Kondisi lubang bukaan bawah tanah ......................... 41
4.2.2. Sifat fisik dan sifat mekanik batuan ......................... 41
4.2.3. Sifat rockbolt dan shotcrete ....................................... 42
4.3. Pengolahan data Klasifikasi RMR ................................. 43
4.3.1. Penentuan Orientasi Keluarga Kekar ......................... 43
4.3.2. Parameter Kuat Tekan Batuan ..................................... 44
4.3.3. Parameter RQD .......................................................... 44
4.3.4. Parameter Jarak Kekar ................................................. 44
4.3.5. Parameter Kondisi Kekar ............................................. 45
4.3.6. Parameter Kondisi Air Tanah ...................................... 45
4.3.7. Pengaruh Arah Umum Bidang Diskontinu terhadap Penggalian ................................................................. 45
4.3.8. Penentuan Nilai dan Kelas RMR ................................. 46
4.3.9. Penentuan Tinggi Runtuh dan Beban Runtuh ................. 47
4.3.10. Penentuan Penyangga Berdasarkan RMR ................. 48
4.4. Analisis Balik Dengan Menggunakan Permodelan Numerik (finite element method) ............................................ 49
4.5. Permodelan Penyangga Menggunakan Permodelan Numerik (finite element method) ........................................... 54

V PEMBAHASAN ........................................................................ 56
5.1. Klasifikasi Dan Kekuatan Massa Batuan Blok Cibitung .... 56
5.1.1. Karakteristik Dan Klasifikasi Massa Batuan Blok Cibitung 56
5.1.2. Kekuatan Massa Batuan Blok Cibitung Berdasarkan Analisis Balik ................................................................. 56
5.2. Analisis Kecukupan Penyangga Berdasarkan Permodelan Numerik ................................................................. 57
5.3. Analisis Desain Sistem Penyangga Berdasarkan Permodelan Numerik ................................................................. 59

VI KESIMPULAN DAN SARAN .............................................. 65
6.1. Kesimpulan ........................................................................ 65
6.2. Saran .................................................................................. 65
