ISSN: 2186-2982(Print), 2186-2990(Online)

International Journal of GEOMATE is Abstracted/Indexed in: SCOPUS, Web of Science Emerging Sources Citation Index (ESCI), EBSCO, Global Impact Factor (GIF), Gale (a Cengage Learning Company), ULRICHSWEB, Global Serials Directory, etc.

Impact Factor (by GIF): 2015: 1.009; 2014: 0.987; 2013: 0.825; 2012: 0.714
Paper acceptance rate: 2015: 35.28%; 2014: 37.5%; 2013: 38.71%; 2012: 46.66%; 2011: 61.53%

Honorary Editor
Prof. Dr. Shoji Inoue, Professor Emeritus, Mie University, Japan

Editor-in-Chief:
Prof. Dr. Zakaria Hossain, Mie University, Japan

Assistant to the Editor-in-Chief:
Dr. Jim Shiau, University of Southern Queensland, Australia

Associate Editors:
Prof. Dr. Fumio Tatsuoka, Tokyo University of Science, Japan
Prof. Dr. Sai Vanapalli, University of Ottawa, Canada
Prof. Dr. Ian Jefferson, University of Birmingham, United Kingdom
Prof. Dr. Mounir Bouassida, National School of Engineering of Tunis
Prof. Dr. Bujang B.K. Huat, University Putra Malaysia, Malaysia
Prof. Dr. Nemy Banthia, University of British Columbia, Canada
Prof. Dr. Toshinori Sakai, Mie University, Japan
Prof. Dr. Valeriy Perminov, Tomsk Polytechnic University, Russia
Prof. Dr. Jing-Cai Jiang, University of Tokushima, Japan
Prof. Dr. Lilia Robles Austriaco, Angles University Foundation, Philippines
Prof. Dr. Muhammad Ibn Ibrahimy, International Islamic University, Malaysia
Prof. Dr. Shamsul I. Chowdhury, Roosevelt University, USA
Prof. Dr. Isabel Pinto, University of Coimbra, Portugal
Prof. Dr. Mark Jaksa, University of Adelaide, Australia
Prof. Dr. Kaneco Satoshi, Mie University, Japan
Prof. Dr. Junichiro Takeuchi, Kyoto University, Japan
Prof. Dr. Ranjith Pathegama Gamage, Monash University, Australia
Prof. Dr. Kingshuk Roy, Nihon University, Japan
Prof. Dr. Md. Shahin Hossain, Islamic University of Technology, Bangladesh
Prof. Dr. Pedro Arrua, Universidad Tecnológica Nacional, Argentina
Prof. Dr. Miguel A. Pando, University of North Carolina, USA
Prof. Dr. Suksun Horpibulsuk, Suranaree University of Technology, Thailand
Prof. Dr. Musharraf Zaman, University of Oklahama, USA
Prof. Dr. Rafiqul Tarefder, University of New Mexico, USA
A/Prof. Dr. John Victor Smith, RMIT University, Australia
Prof. Dr. Basir Mir, National Institute of Technology Srinagar, India

INTERNATIONAL JOURNAL OF GEOMATE
(Geotechnique, Construction Materials & Environment)
ISSN: 2186-2982(Print), 2186-2990(Online)

Founded in 2011, *The* "*International Journal of GEOMATE*" is a Scientific Journal of the GEOMATE International Society that encompasses a broad area in Geotechnique, Construction Materials, and Environment. The key objective of this journal is to promote interdisciplinary research from various regions of the globe. The editorial board of the journal is comprised of extensively qualified researchers, academicians, scientists from Japan and other countries of the world. It is a peer-reviewed journal that is published quarterly. All articles published in this journal are available online. Contributors may download the manuscript preparation template for submitting paper or contact to the Editors-in-Chief [editor@geomatejournal.com].

Aims and Scopes:

The journal aims to become an efficient mean of publishing and distributing high-quality information from the researchers, scientists, and engineers. The main scopes are as follows:

- Advances in Composite Materials
- Computational Mechanics
- Foundation and Retaining Walls
- Slope Stability
- Soil Dynamics
- Soil-Structure Interaction
- Pavement Technology
- Tunnels and Anchors
- Site Investigation and Rehabilitation
- Ecology and Land Development
- Water Resources Planning
- Environmental Management
- Earthquake and Tsunami Issues
- Safety and Reliability
- Geo-Hazard Mitigation
- Case History and Practical Experience
- Others

Review Policy:

- The paper which meets the editorial criteria will be assigned to at least two anonymous reviewers for peer-review.
- Authors may recommend some reviewers - however, Editors are entitled to consider them or not.
- The Editorial Board consists of an outstanding group that is responsible for the review process of the submitted manuscripts and will guarantee the quality of the publication.
- The manuscript will be published as soon as it is accepted and all the modifications recommended by the reviewers are made.
- The review procedure is as strict as in the most prestigious journals, but publication time is minimized.
- Based on the reviewers' comments, the Editors will make a decision on a paper as one of the following four conditions:

1. Accept without revision
2. Accept with minor revision
3. Encourage to resubmit with major revision
4. Reject

In case of acceptance with either minor or major revisions, the authors will be advised to revise the manuscript according to the reviewers' comments.

INTERNATIONAL JOURNAL OF GEOMATE
(Geotechnique, Construction Materials & Environment)
ISSN: 2186-2982(Print), 2186-2990(Online)

Instruction to Author:

The manuscript to be submitted should be prepared using the manuscripts submission template.
Download the manuscript formatting template from download files menu.
The manuscript to be submitted adheres to the rules and guidelines given in manuscript template.
The manuscript should be written in English. List of references must be translated into English if other languages (both should be written).
The page limit is 8 pages for ordinary manuscript and 10 pages for the invited manuscript.
The references inside the text and in the bibliographic list should follow the formats as per the manuscript template.
All figures, graphs, and tables must follow the font-style of the text. Ensure clear and good quality picture in the first submission.
Selected manuscript from "GEOMATE Conference Presentation" will be reprinted in the journal with nominal charges (40% discount of regular fees) based on the agreement of the authors.
Accepted papers which were not presented in "GEOMATE Conference" need publication charges of 800 USD as regular fees. Any page or fraction thereof exceeding page limit will be charged 100 USD per page. Extra author fee is 100 USD/author if exceeding 5 authors.
This is required for its maintenance such as managing article submission and peer review, typesetting, tagging and indexing of articles, hosting articles on dedicated servers, supporting sales and marketing costs to ensure global dissemination via different databases, and permanently preserving the published journal article.
Copyright: GEOMATE required to obtain copyright of papers from authors for the term of copyright by signing and returning the publishing agreement.

Submission Method:

Submit full manuscript online using "Submission" menu. We accept online submission only.
Copyright release form to be e-mailed separately along with the manuscript submission. Download it from the “Download Files Menu”.
Abolition of printed version: Considering environmental conservation, the paper version has been discontinued since June 2016.
For any questions: Contact us [editor@geomatejournal.com].

Membership Fees: Regular Member 100USD/year; Life Member 900USD only.

Membership Benefits:
- Receive Membership ID/Card
- Use M.G. or L.M.G. after your name (M=Member, G=Geomate, L=Life)
- Be involved in GEOMATE technical committees and activities
- Be up-to-date on the current development in the field
- Priority right to participate in international conferences with 20% discount
- 20% discount for Journal paper publication
- Vote in the election of GEOMATE officers
- Access to the Journal webpage

Membership Application (send the related items below using online form):

- Full Name:
- Title/Position (check one): □ Prof. □ A/Prof. □ Dr. □Mr. □Ms.
- Membership Category (check one): □ Regular Member □ Life Member □ Others
- Address:
- Tel & Fax:
- E-mail (co-authors email separated by comma):
- Research Area (check one): □ Geotechnique □ Construction Materials □ Environment □ Others

INTERNATIONAL JOURNAL OF GEOMATE
(Geotechnique, Construction Materials & Environment)
ISSN: 2186-2982(Print), 2186-2990(Online)

STATEMENT ON PUBLICATION ETHICS AND PUBLICATION MALPRACTICE (1/2)

The International Journal of GEOMATE is a double-blind peer-reviewed journal. All parties involved in the act of publishing an article for this journal, i.e.: the editors, the author, the peer-reviewers and the publisher must follow the ethical behavior indicated in the COPE's Best Practice Guidelines for Journal Editors. In order to warrant high-quality scientific publications, public trust in scientific findings, and that people receive credit for their ideas, the ethical standards for publication are followed.

DUTIES OF EDITORS

A decision on the Publication of Article: Based on the double-blind peer review of a paper, the Chief Editor and the Associate Editor are responsible for deciding which of the articles accepted for publication. Neither the Chief Editor nor the Associate Editor has the authority to influence the reviewers who are conducting the blind review of the articles submitted for peer review. The Chief Editor and the Associate Editor may be guided by the policies of the journal's Editorial Board and subjected to such legal requirements regarding libel, copyright infringement, and plagiarism.

Honest Play: Manuscripts submitted to GEOMATE shall be exclusively evaluated based mainly on their intellectual quality and significance. GEOMATE will not give any consideration to authors' race, gender, sexual orientation, religious beliefs, ethnic origin, citizenship, or political philosophy.

Confidentiality: The Chief Editor, the Associate Editor, and any editorial staff must not disclose any information about a submitted manuscript to anyone other than the corresponding author, reviewers, potential reviewers, other editorial advisers, and the publisher.

Disclosure and Conflicts of Interest: Unpublished materials disclosed in a submitted manuscript must not be used by anyone who has a view of the manuscript (while handling it) in his or her own research without the express written consent of the author.

DUTIES OF REVIEWERS

The contribution of Double-Blind Peer Review: Any identifying information will be stripped out from the submitted paper so that the reviewers do not know any information about the authors and vice versa i.e.: reviewers' comments to the editors are confidential and before passing on to the authors, it will be made anonymous. The Double Blind Peer review assists the reviewers in making editorial decisions, while editorial communications with the author may also assist the author in improving the manuscript. The names of the reviewers known only to the Chief Editor and the Associate Editor and it remains strictly confidential to authors.

Punctuality: Any selected referee who feels unqualified to review the assigned manuscript or unable to provide a prompt review should notify the Chief Editor and the Associate Editor and excuse himself/herself from the review process.

Confidentiality: Private information or ideas obtained through double-blind peer review must be kept confidential and not used for personal advantage. Manuscripts received for review must be treated as confidential documents. Without any authorization by the Chief Editor and the Associate Editor, the information of the submitted manuscript must not be shown to or discussed with, others.

Standards of Objectivity: There shall be no personal criticism of the author. Reviewers should express their views clearly with supporting arguments and reviews should be conducted objectively.

Acknowledgment of Sources: Authors should cite relevant references and corresponding citation if any statement in the submitted paper had been previously published or reported elsewhere. Reviewers should identify relevant published work that has not been cited by the authors. If a reviewer finds any substantial similarity or overlap between the submitted manuscript and any other published works, s/he should inform the Chief Editor/Associate Editors.

Conflict of Interest: In any reviewers find that the submitted manuscript has conflicts of interest resulting from competitive, collaborative, or other relationships or connections with any of the authors, companies, or institutions, s/he should not review that manuscripts and notify to the Chief Editor/Associate Editors prompt.

DUTIES OF AUTHORS

Reporting Standards: Authors of papers of original research should present an accurate account of the work performed as well as an objective discussion of its significance. Underlying data should be represented accurately in the paper. A manuscript should contain sufficient detail and references to permit others to replicate the work. Fraudulent or knowingly inaccurate statements constitute unethical behavior and are unacceptable.

Data Access and Retention: Authors may be asked to provide the raw data in connection with a paper for editorial review, and should be prepared to provide such data for public access or for access to the readers of the journal.

Originality and Plagiarism: The authors should ensure that they have written entirely original works, and if the authors have used the work and/or words of others, this must be appropriately cited or quoted. All papers published by International Journal of GEOMATE are committed to publishing only original material, i.e., material that has neither been published elsewhere nor is under review elsewhere. The paper that is found to have been plagiarized from a manuscript by other authors, whether published or unpublished, will incur plagiarism sanctions.

INTERNATIONAL JOURNAL OF GEOMATE
(Geotechnique, Construction Materials & Environment)
ISSN: 2186-2982(Print), 2186-2990(Online)

STATEMENT ON PUBLICATION ETHICS AND PUBLICATION MALPRACTICE (2/2)

Acknowledgment of Sources: Proper acknowledgment of the work of others must always be given. Authors should cite publications that have been influential in determining the nature of the reported work.

Manipulation of Citations: Submitted papers that are found to include citations whose primary purpose is to increase the number of citations to a given author's work, or to articles published in a particular journal, will incur sanctions for manipulation of citations.

Falsification and Fabrication: Submitted papers that are found to have either falsified or fabricated numerical/experimental results, including the manipulation of images, will incur data fabrication and falsification sanctions.

Authorship: The authorship of a paper should be limited to those who have made a significant contribution to the conception, design, execution, or interpretation of the reported study. All those who have made significant contributions should be listed as co-authors. Where there are others who have participated in certain substantive aspects of the research project, they should be acknowledged or listed as contributors.

Scientific Contribution: All listed authors must have made a significant scientific contribution to the research in the manuscript and approved all its claims. It is important to list everyone who made a significant scientific contribution, including students and laboratory technicians.

Corresponding Author: Corresponding Author is the author responsible for communicating with the journal for publication. The corresponding author should ensure that all appropriate co-authors and no inappropriate co-authors are included on the paper and that all co-authors have seen and approved the final version of the paper and have agreed to its submission for publication.

Acknowledgment of Funding Sources: Funding sources for the research reported in the manuscript should be duly acknowledged after the conclusion and before the list of references.

Disclosure and Conflicts of Interest: All sources of financial support for the project or any substantive conflict of interest that might be interpreted to influence the results of the paper should be disclosed.

Fundamental Errors in Published Works: It is the author's responsibility to promptly notify the Chief Editor/Associate Editor if s/he discovers a significant error or inaccuracy in his/her own published work to retract or correct the paper.

Redundant, Concurrent or Multiple Publications: An author should not, in general, publish manuscripts describing essentially the same research in more than one journal or primary publication. Manuscripts that are found to have been published elsewhere, or to be under review elsewhere, will incur duplicate submission/publication sanctions. If authors have used their own previously published work or work that is currently under review, as the basis for a submitted manuscript, they are required to cite the previous work and indicate how their submitted manuscript offers novel contributions beyond those of the previous work. Submitting the same manuscript to more than one journal concurrently constitutes unethical publishing behavior and is unacceptable. Redundant publications involve the inappropriate division of study outcomes into several articles.

SANCTIONS
In the event that there are documented violations of any of the above-mentioned policies in any journal, regardless of whether or not the violations occurred in a journal published by GEOMATE, the following sanctions will be applied:
•*Immediate rejection of the infringing manuscript.*
•*Immediate rejection of every other manuscript submitted to GEOMATE by any of the authors of the infringing manuscript.*
•*The prohibition against all of the authors for any new submissions to GEOMATE, either individually or in combination with other authors of the infringing manuscript, as well as in combination with any other authors. This prohibition will be imposed for a minimum of five years.*
•*Prohibition against all of the authors from serving on the Editorial Board of the International Journal of GEOMATE*

In cases where the violations of the above policies are found to be particularly outrageous, the publisher reserves the right to impose additional sanctions beyond those described above.

ABSTRACT: The study area is on the southern slope of Merapi Mountain in Yogyakarta, and focus on the relation of satellite imagery with piezometric and structure compartment. The preliminary geological study of satellite imagery is using a digital elevation model and Landsat 8 data extraction. The morphometry initiation is used to get the structure lineaments compartment, and it came from morphometry quantification value to indicating the implication of geological structure controls to the groundwater level distribution. The methods emphasize the quantitative descriptive approach form morphometry equation. Thus quantitative morphometry methods are then follow up by statistical and hierarchical cluster analysis of piezometric. The result of morphometry variable shows the structural lineament creates and control by active tectonics, and it implacable to the piezometric spatial distribution besides the implication of volcanic deposit variation, uplifting and asymmetric river mature form. The statistical analysis represents a relation between structure lineament with the piezometric, and the analysis result imaging on the digitized maps for each compartment compares with the trends of piezometric. The result of this study emphasizes that the initiation of morphometry is needed to use to compartmentation the structure lineaments, and the compartment becomes the controller of piezometric distribution.

Keywords: Morphometry, structure lineament, piezometric, groundwater

1. INTRODUCTION

The crucial stage that happens in the slope of Merapi Mountain as the preserve recharge zone is a morphological change from the wide-opening valley to narrow-closing of the stream. This deformation was causing groundwater level differences with the geological structure to involve. This phenomenon investigates with morphometry initiation using a digital elevation model (DEM) and Landsat 8 imagery data extraction. The extraction is visualizing the remote sensing process in a geographic information system (GIS). This imagery use for the watershed network [1], geological structure lineaments evaluation [2, 3], and it use for piezometric modeling associated with the neotectonic activity reflecting from landform imagery deformation [3, 4, 5]. Morphometry is part of the evaluation of geological structure involvement for structural change on the stream, and the morphology, and it can visualize the variation of piezometric [6].

The streams of Gendol, Opak, Kuning and Boyong is the specific location study objective in the southern slope of Merapi volcanic in Yogyakarta, Indonesia. The lithological unit is depositing on the river's location are composed of young Quarternary pyroclastic rock from the Merapi volcano deposits. The deposits are tuff, ash, breccias, agglomerates, lava, and avalanches deposit [7]. The involvement of these lithological varies responsibility for the changing of the piezometric groundwater level. This changing developed a high-performance solution with morphometry initiation, involving the lineament compartments and piezometric on the pattern of the groundwater flow stage. This research workable to delineate the structural, spatial trend into three different zones. They are analyzing and modifying the different of the piezometric compartment by hierarchical cluster analysis, depicted in the piezometric map and lineament spatial distribution.

2. METHODS

The morphometry and hydrogeological data were analyzing the determination of the existence of the geological structure implication; they also analyze the piezometric groundwater evolution. The statistical relation between piezometric and structural lineament shows in the spatial distribution lineaments and piezometric map. Data

management of morphometry and piezometric systematically arranged and aligned into GIS. The extraction data came from the imagery of DEM 30-meter resolution and Landsat 8 imagery data [8] using band 7 for 30-meter and band 8 for 15-meter resolution. The extraction exports to computer-aided design (CAD) and PCI Geomatica to different interpretation data. GIS data constructed to specific information on morphology by calculating the quantitative variables from the surface formation.

The surface information used to determine the value of the geomorphic index, the level of tectonic activity, dimensional aspects such as length and azimuth of river segment, aligned azimuth, flow density, river order, and river ratios, and elevation.

A score of an existing geomorphic index using the formula of each variable, and then used for the analysis of tectonic activity. Bifurcation of the ratio (Rb) is the result of the comparison of the number of a specific order (Σn) river segments with the number of next order (n+1) river segments [9] as in

$$\mathrm{Rb} = \frac{\Sigma n}{n+1} \quad (1)$$

Drainage density (Dd) is obtaining by calculating the total length of streamflow (ΣLs) compared to the total watershed area (A) [10] as in

$$\mathrm{Dd} = \frac{\Sigma \mathrm{Ls}}{\mathrm{A}} \quad (2)$$

The sinuosity of mountain front (Smf) is the result of the comparison of the surface length of mountain face (Lmf) to the long straight of mountain face (Ls) [11] as in

$$\mathrm{Smf} = \frac{\mathrm{Lmf}}{\mathrm{Ls}} \quad (3)$$

Valley ratio or comparison of valve width and height (Vf) obtained by comparison of valley width (Vfw) with the height of the right (Eld-Esc) and left valleys (Erd-Esc), as well as the valley ratio elevation [12] as in

$$\mathrm{Vf} = \frac{2\mathrm{Vfw}}{[(\mathrm{Eld}-\mathrm{Esc})+(\mathrm{Erd}-\mathrm{Esc})]} \quad (4)$$

The asymmetry factor or the value of river asymmetry (AF) can show the tectonic effect seen from the flow pattern [13, 14]. It can obtain from the comparison of the river basin area (Ar) with the total area (At) of the river basin [15] as in

$$\mathrm{AF} = 100 \times \frac{\mathrm{Ar}}{\mathrm{At}} \quad (5)$$

The stream length or value of the river gradient index (SL) is deriving from the multiplication of the total length (L) of the river by the ratio of the elevation difference (ΔH) from the point calculated by the length (ΔL) of the river [15] as in

$$\mathrm{SL} = \frac{\Delta \mathrm{H}}{\Delta \mathrm{L}} \times \mathrm{L} \quad (6)$$

Hypsometric integrals (Hi) are calculating the difference in average elevation with minimum elevation, divided by the maximum elevation difference with minimum elevation [16] as in

$$\mathrm{Hi} = \frac{\mathrm{H\ mean}-\mathrm{H\ min}}{\mathrm{H\ max}-\mathrm{H\ min}} \quad (7)$$

Transverse topographic symmetry (T) is calculating from the ratio of the midline distance from the valley to the maximum height with the diameter spacing from the valley to the minimum height [17, 15] as in

$$\mathrm{T} = \frac{\mathrm{Da}}{\mathrm{Dd}} \quad (8)$$

Elongation of basin ratio (Eb) is obtaining from the ratio of roots to diameter of the circle of the river basin divided by phi, with the length of the watershed [18, 13] as in

$$\mathrm{Eb} = \frac{2\sqrt{\frac{\mathrm{Ab}}{\pi}}}{\mathrm{lb}} \quad (9)$$

The extracted data analyze, including the geological structure such as slope, curvature, aspect, hillshade, lineament, fault, fracture, and piezometric.

This study was using geostatistical analysis to interpret the morphometry and groundwater level spatial distribution, also the influence of groundwater flow and structure involvement. The relation between morphometry and piezometric in the geological structure compartment of the fault is using the hierarchical cluster analysis. Hierarchical cluster analysis using Euclidean distance (space of straight-line calculation from two-point between angle and distance) for same distance measurements. Ward's method for clustering classification, base on the missing information because of object merging to cluster and its measuring use total of square deviation on the mean cluster. It is the Software Statistical Package for the Social Sciences (SPSS) that we used to analyze all samples statistically in piezometric.

Piezometric data mapped by kriging gridding method with Surfer software using a non-directional variogram estimator type. Experimental variograms of piezometric parameters show a sharp curve and linear with spherical variogram component model — the data collected along with the general directions of the regional groundwater flow direction. The data do not tightly cover the

entire study area, particularly in the north of a compartment where the data are too rare, and it very close to the top of the volcano. Even the computational technique used for closing the weak data area; there is no other way to make estimating maps for piezometric parameters. The interpretation of interpolation every computed method compares with realizing errors from counting. Comparison of the generated morphometry and piezometric map evaluated in statistical such as maximum, minimum, mean, and variance. All this method were enforced to a geostatistical framework to explain the groundwater piezometric characteristic of the structural compartmentalization.

3. RESULT AND DISCUSSION

The initiate morphometry distribution of watershed flow is assessing by knowing the value of the ratio of bifurcation and drainage density to find out the deformed landform and lithological resistance. Refer to "Eq. (2)" the lower density 3.4 Kuning and 3.9 Opak are indicating a more resistant rock, found in lower reliefs being lightly eroded and having infiltration capacity with good permeability. Density in the Gendol 4.5 can indicate the softer rocks, and Boyong 4.8 indicates a strongly eroded watershed, as shown in Tabel 1.

The Smf calculation refers to "Eq. (3)" from 22 incision relief result minimum number are 1.4 indicates an active tectonic in high level with a full ridge shape, dominant swelling, and erosion, the Smf maximum number are 2.8 is the medium level of tectonic activity.

The Vf calculation refers to "Eq. (4)" results show high uplift level 0.001 to 0.370 and low uplift rate 1.207 to 15.293, counted value less than 0.5 equal to 65% from 22 incision relief, that value indicates the area dominated by high elevation level.

AF calculations refer to "Eq. (5)" in the stream of each with a value of 32.0, 16.7, 31.9, and 19.4, a value less than 50 points indicates a slope due to tectonic movement. The SL calculations "Eq. (6)" on the Gendol show, 5.9 points of value is reflecting the lowest tectonic activity other than Opak 12.2, Kuning 8.6, and Boyong 8.8.

The value of Hi "Eq. (7)" by comparison of elevation (h/H) and river area (a/A) indicates that the integral equations of hypsometry are in the same progression of the mature river, with Gendol 0.407 and 0.480, Opak 0.570 and 0.403, Kuning 0.403 and 0.487, and Boyong 0.426 and 0.415.

The accumulated calculation of the T value "Eq. (8)" shows that the asymmetry value of the river has shifted from the left to the right and has moved towards the West.

The values of Eb calculated "Eq. (9)" from rivers above 0.002-0.004 indicate very elongated, so that river characters classified to tectonically active due to erosion.

The extracted imagery of DEM and Landsat 8 lineaments are analysis using the lighting of azimuth angle, and for the azimuth, straightness showing different directions and does not follow the same pattern. The direction of the azimuth lineaments from DEM 0º-45º-90º-135º show almost has a similar rose diagram with band 7 that higher concentration in the northeast to southwest. DEM 80º-225º-270º-315º shows a higher concentration in the northwest to southeast trend. The azimuth lineaments direction band 8 show east-west, north-south, northeast-southwest, and northwest-southeast trend.

Map of DEM 0º-45º-90º-135º, DEM 80º-225º-270º-315º, Landsat band seven and band 8 shows the classification of lineaments into three sections, which is a draw to the lines of interpretation as structure boundary that cross-cut the lineaments of northeast-southwest direction, as shown in Fig. 1.

Table 1 Morphometric variable to recognize the active tectonic activity.

Morphometry	Stream			
	Gendol	Opak	Kuning	Boyong
Rb	4.3	2.4	2.2	1.5
Dd	4.5	3.9	3.4	4.8
Smf	1.4 to 2.8			
Vf	0.001 to 0.370 and 1.207 to 15.293			
AF	32.0	16.7	31.9	19.4
SL	5.9	12.2	8.6	8.8
Hi	h/H 0.4 a/A 0.5	h/H 0.6 a/A 0.4	h/H 0.4 a/A 0.5	h/H 0.4 a/A 0.4
T	0.65	0.47	0.63	0.87
Eb	0.004	0.003	0.003	0.003

The structure of the compartment had three sections, the northern compartment as a zone A. The central section as a zone B, and the southern section as a zone C. The boundaries of the A zone of the structure compartment are 750-meter to 400-meter elevation. The boundaries of the second B zone of the structure compartment are 400-meter to 300-meter elevation, and C zone of the structure compartment is 300-meter to150-meter elevation.

Hierarchical cluster analysis indicates that the groundwater depth divided into three clusters. This cluster is shown in Fig. 2 on the cluster map and the piezometric pattern in Fig. 3. There was the same interpretation between the structure compartment zone, as shown in Fig. 1, with the division of the piezometric cluster, as shown in Fig. 3.

The structure in each zone A, B, and C corresponds to each cluster one, two, and three piezometric geometry profile. The groundwater table usually follows the local topography [20]. In the profile of topography geometry and piezometric as shown in Fig. 4, groundwater flows from north to south, vertically faulting with normal fault.

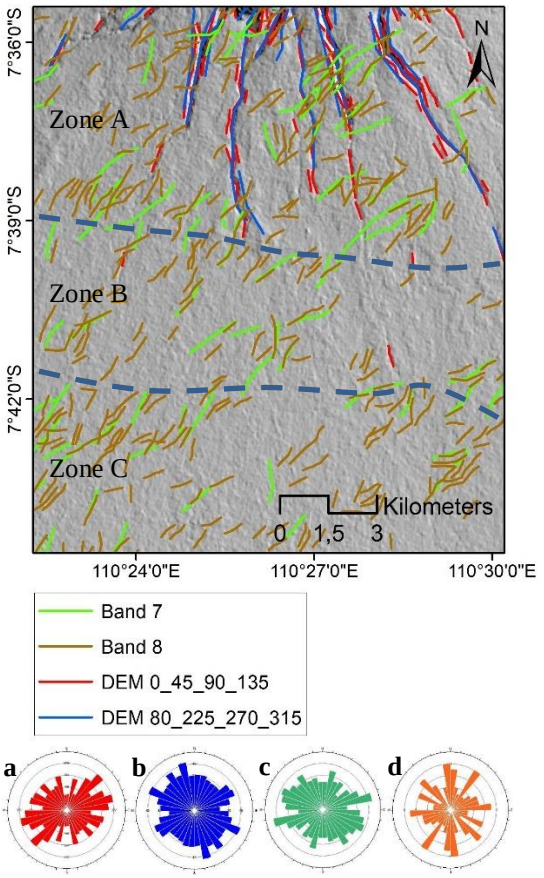

Fig. 1 Lineaments of Landsat and DEM showing the different paths and different direction. Band 7 (a), band 8 (b) DEM 0-45-90-135 (c), and DEM 80-225-270-315 (d), all lineaments trends differently.

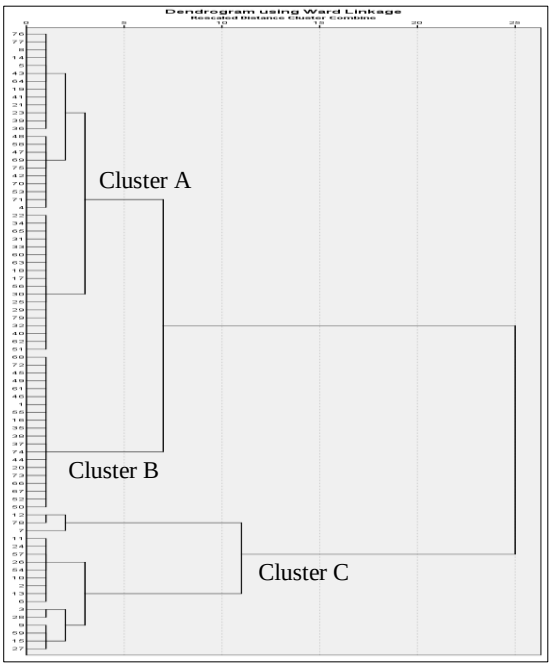

Fig. 2 Dendrogram divided by hierarchical cluster analysis to three clusters.

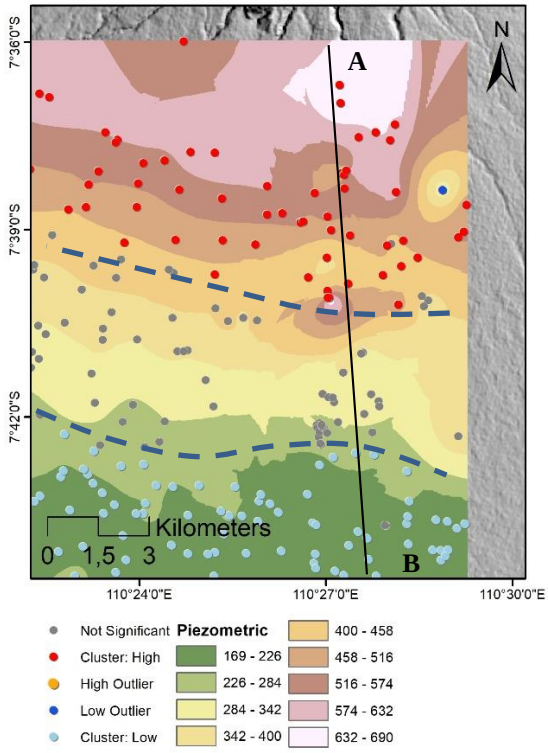

Fig. 3 Piezometric of weighted features, identifies statistically significant groundwater level and spatial outliers using the cluster analysis.

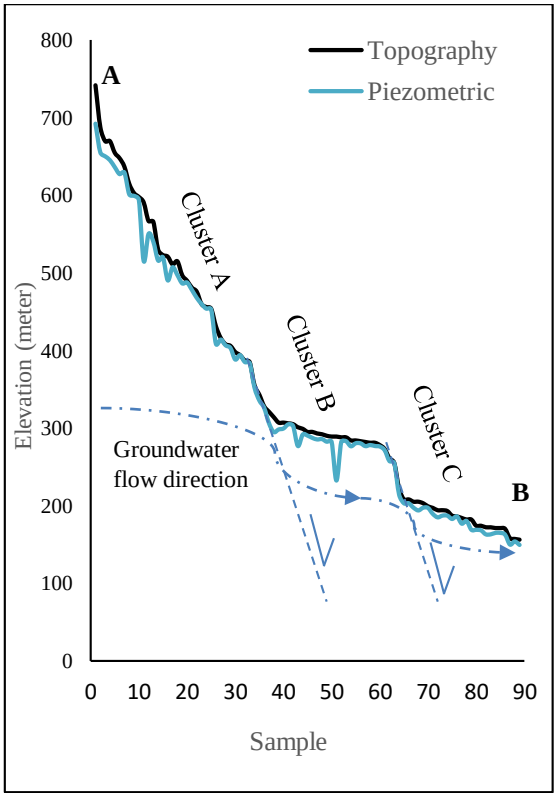

Fig. 4 Profile of topography geometry and piezometric shows divided zone that conformable with structure.

Statistics calculations used for each zone are the minimum and maximum values of depth, and the height of groundwater, the sinuosity of the mountain front (Smf) and the valley ratio (Vf). The value of the relationship between the geological structure with changes in the depth and height of groundwater levels, which then compared with the values of Smf and Vf.

Table 2 Statistics calculations used for each zone are the minimum and maximum values of depth, and the height of groundwater.

Zone		Gendol		Opak	
		Depth	Height	Depth	Height
A	Min	4	4	4	9
	Max	50	64	68	50
B	Min	1	1.2	1	1
	Max	33	50	45	10.9
C	Min	2	1.6	3	2.6
	Max	22	22	10	10

Table 3 Statistics calculations used for each zone are the minimum and maximum values of the mountain front (Smf) and the valley ratio (Vf).

Zone		Smf		Vf	
		Gendol	Opak	Gendol	Opak
A	Min	0.294	0.448	0.021	0.001
	Max	0.550	0.553	40	7.675
B	Min	0.397	0.484	0.711	0.429
	Max	0.533	0.728	10	6.667
C	Min	0.408	0.523	1.052	0.533
	Max	0.476	0.540	14.286	20.571

Zone A Gendol River with a range of values: groundwater depth 4 meters to 50 meters, groundwater level 4 meters to 68 meters, Smf with values of 0.294 to 0.550, Vf with values of 0.021 (high uplift) to 40 (very low uplift). Zone A Opak River with a range of values: depth of groundwater level of 4 meters and a maximum of 68 meters, groundwater level of 9 meters to 50 meters. Smf value of 0.448 to 0.553, Vf value of 0.001 (high uplift) to 7.675 (very low uplift), as shown in Table 2 and Table 3.

Zone B in the Gendol watershed shows the range of values: groundwater depth of 1 meter to 33 meters, groundwater level height of 1.2 meters to 50 meters, Smf value of 0.484 to 0.728, Vf value of 0.711 (moderate uplift) to 10 (low uplift). Zone B in the Opak watershed shows the range of values: groundwater depth 1 meter to 45 meters, groundwater level 1 meter to 10.85 meters, Smf values 0.523 to 0.540, Vf 0.429 (high uplift) to 6.667 (low uplift), as shown in Table 2 and Table 3.

Zone C in the Gendol watershed shows the range of values: groundwater depth of 2 meters to 22 meters, groundwater level height of 1.6 meters to 22 meters, Smf value of 0.408 to 0.476, Vf value of 1.052 (low uplift) to 14.286 (very low uplift). Zone C in the Opak watershed with a range of groundwater depths of 3 meters to 10, groundwater level height of 2.6 meters to 10. Smf values of 0.523 to 0.540, Vf with a minimum value of 0.533 (moderate uplift) and a maximum of 20,571 (very low uplift), as shown in Table 2 and Table 3.

Groundwater flows directions depicted on the piezometric map with the kriging method flowing from the northeast direction with higher elevations to the southwest with lower elevations. The following is an illustration of a piezometric map showing the direction of groundwater flow and groundwater level in each zone.

Groundwater flow follows the direction of the slope of the rock layer, and in the direction of the slope, this shows that the recharge originates from higher elevations, especially from zone A to zone B and continuously to zone C.

Geological structure lineaments act as a boundary toward groundwater flow and lithology slope between different structural divisions. The northeast-southwest-directed structure is a structure used by groundwater flow to connect to the zone above or below, which also functions as a barrier to groundwater flow from north to south.

The results of the ANOVA statistical analysis showed that the groundwater depths of zone A, zone B, and zone C were utterly different. Correlation test results show a reasonably strong correlation between the variable direction of flow and depth of groundwater, and the results of regression tests show the direction of flow and depth of groundwater affect the structure azimuth.

From the ANOVA test, the F count is 12.43 with a significance level or probability of 0.000, a probability of less than 0.05 then the regression model can be used to predict the structure azimuth, or the direction of flow and depth of groundwater affect the structure azimuth, as shown in Table 4.

Table 4 ANOVA with structure azimuth as the dependent variable.

Model	Sum of Squares	df	Mean Square	F	Sig.
Regression	43319.80	2	21659.90	12.43	0.000[a]
Residual	132410.57	76	1742.24		
Total	175730.38	78			

a. Predictors: (Constant), Groundwater depth, groundwater flow.

Table 5 Coefficient with structure azimuth as the dependent variable.

Model	B	Std. Error	Beta	t	Sig.
(Constant)	-3.631	33.009		-0.110	0.913
Flow	30.63	6.635	0.509	4.616	0.000
Depth	0.118	0.410	0.032	0.289	0.774

Regression equation with structure azimuth (Y) is related to the groundwater flow direction (X_1) and groundwater depth (X_2), as in

$$Y = (-3.631) + 30.629\ X_1 + 0.188\ X_2 \quad (10)$$

A constant of unstandardized coefficients (B) -3.631 states that if the direction of flow is absent or there is no groundwater depth, the azimuth direction of the structure is 3.631°. Regression coefficient X_1 of 30.629 states that any change in groundwater flow direction 1° will change the direction of the structure azimuth by 30.662°. The regression coefficient X_2 of 0.188 states that each additional 1-meter groundwater depth will change the azimuth structure direction of 0.188°, as shown in Table 5.

T-test intent to test the significance of constants and dependent variables (groundwater flow) as seen in the numbers Significance or probability value below 0.025, both significant regression coefficients or groundwater flow direction have a significant effect on azimuth structure, while groundwater depth is not significant.

4. CONCLUSION

The study of the structure compartment on the southern Merapi volcanic slope using a method that combines quantitative morphotectonic with piezometric characteristics. The combination is verified with statistical data analysis to prove that lineament forming due to active tectonic structure.

The morphometry initiation results in the classification of DEM and Landsat lineaments into three sections, as structure boundary that cross-cut the lineaments. The structure compartment had three sections, as a zone A, zone B, and zone C. Also shows the hierarchical cluster analysis classified into three clusters, it has defined the interpretation of spatial dependencies.

The results of a statistical analysis of the ANOVA, correlation test, and regression tests showed every groundwater depths of zone A, zone B, and zone C were utterly different. The direction of flow and groundwater depth have a strong correlation, and it affects the structure azimuth.

The equation of regression $Y = (-3.631) + 30.629\ X_1 + 0.188\ X_2$, mention that groundwater flow direction has a significant effect on azimuth structure, while groundwater depth is not significant. Any change in groundwater flow direction will change the direction of the structure azimuth. The relationship between groundwater compartments, the structure becomes the controller of the groundwater depth distribution, besides the Quaternary lithology.
